Aren't you tired of this phrase?

"Frontend is easy."

But is frontend that easy that everyone says?

Is frontend only just **HTML**, **CSS** and **JavaScript**?

Well if you encounter such people then, its's time to throw this insight with slap in their face. I have been working as a **full-stack developer** for years and I find **frontend** development harder than **backend**. Why? Because I think frontend has too **many aspects** to take care about.

In today's post we will see the "State of Frontend in 2022" that will help you conclude , ***is frontend that easy as you think?***

Still think frontend development is easy? I don't think so. Most of the people when they hear frontend development think its just **HTML, CSS & JavaScript**. But its 2022, **situation** is changed, **technology** is changed and now frontend development is evolving at a rapid pace.

I think "**HTML, CSS & JS**" only is not enough in **2022** to become a **better** frontend developer.

Now whenever someone says frontend development is easy, show them this insight and see what do they think.
