

WHAT ARE PROMISES

You want to go on an vacation

You have lot of work to be done

So you ask your friend's help to
book the plane tickets

And you ask him to inform you the status whether
booking is done or cancelled so you can decide other
transports (boat) if cancelled

Please book the tickets
and inform me the Status

Sure I promise
you to do so

Ticket booking Status = pending

as you haven't received any message from your friend

In mean time, you continue to finish other works

Even though you complete all other works, the vacation's final status still depends on the status of ticket booking

There are 2 possibilities you could expect

Everything went well and
your friend got the tickets

Something bad might happen
and flights got cancelled

Ticket booking Status = Resolved

Ticket booking Status = Rejected

As your friend promised , he messages you the Status

So you can proceed further

Ticket booking Status = Resolved

Ticket booking Status = Rejected

Bye Bye Bugs

Ok, Let me check
Ship availabilities

This is the exact same way
Promises work in Javascript

PROMISES

A promise is an object that returns a value
which you hope to receive in the future

This is how the code looks like

```
var promise = new Promise(function(resolve, reject) {  
  // "Producing Code" (May take some time)  
  if (/* everything turned out fine */) {  
    resolve("Lets go to vacation");  
  }  
  else {  
    reject(Error("Try Ship availability"));  
  }  
});  
  
// "Consuming Code" (Must wait for a fulfilled Promise)  
promise.then(function(result) {  
  console.log(result); // "Lets go to vacation"  
}, function(err) {  
  console.log(err); // Error: "Try Ship availability"  
});
```

Benefits of Promises

Better error handling

Better control flow of
asynchronous logic

solves the problem of
callback hell

Improved readability
